Keg Boy C-2

Capacity up to 35 kegs/h (50 l)

How does the Keg Boy C-2 work?

A cleaning- and a filling station are set up next to each other on a base frame. The kegs are pushed across manually and are pressed from above onto the treatment heads by means of pneumatic cylinders. The cleaning- and filling program runs by itself.

The process is run by a Siemens control with text display.

An integrated detergent tank with a chromium nickel steel pump (IP 54) including fresh water input and an automatic level- and temperature control is part of the standard equipment.

Which additional advantages does the Keg Boy C-2 offer you?

- Cleaning is performed by means of a pulsating spraying device optionally with caustic and/or acid. This is the most sterile and best cleaning technology.
- Each step of the cleaning- and filling process is double checked by oscillation sensors and pressure sensors. Filling is performed with special care. Your quality of drinks is guaranteed due to these multiple checks.
- The complete Keg Boy C-2 will be delivered pre-wired, internally piped and tested. You will save installation and commissioning time.
- The machine is designed in an opened way, it is entirely accessible and compact. This makes servicing easier, saves space and guarantees flexibility of your Keg Boy C-2 while project planning.
- World-wide more than 150 machines are installed.

Optional:

- Kegs can be cleaned and filled by means of additional components.
